Baker Hughes provides one proven source for all your completion, workover and fishing needs. Drawing from a full range of patented products and systems, our people work together in a coordinated effort directed at the total picture, not just isolated pieces of it. From well planning to the installation of your completion, it means an integrated solution to optimize production and achieve efficiencies throughout the life of your well.

Baker Hughes products have proven their reliability and durability in virtually every type of well condition encountered worldwide. Our conventional products and systems have provided superior performance for decades. Our extreme environment products meet most severe performance challenges: Arctic-cold surface conditions, high temperatures and high pressures downhole, highly corrosive well environments and the special demands of operating in deepwater and other environments offshore.

Baker Hughes is also an industry leader in advanced technologies such as Multilateral Systems, Intelligent Well Systems™ and Expandable technologies.

For your completion, workover and fishing products or services anywhere in the world, contact your Baker Hughes Representative or the sales and services location nearest you.

Section 2 - Drillpipe
Table Of Contents

API Drillpipe Requirements Drift Test

Drillpipe Size	Drift Mandrel Length	Drift Mandrel Diameter
All EU (Except 3.5", 13.3#)	4"	ID Minus 3/16"

Tensile Requirements

Grade	Yield Strength		Tensile Strength
	Min	Max	Min
	psi	psi	psi
D*	55,000	-	95,000
E	75,000	105,000	100,000
X-95	95,000	125,000	105,000
G-105	105,000	135,000	115,000
S-135	135,000	165,000	145,000

* Grade “D” is no longer listed in API

Range Lengths

	Range 1	Range 2	Range 3
	ft	ft	ft
Total range length, includes	18-22	27-30	38-45
Range length for 95% or more of carload:			
Permissible length, minimum	20	-	-
Permissible variation, maximum	2	-	-
Range length for 90% or more of carload:			
Permissible length, minimum	-	27	38
Permissible variation, maximum	-	2	3

Tolerances

Drillpipe Size	Dimension	Tolerance
in.		in.
2.375 - 3.500	OD■	+ 3/32, - 1/32
4.000 - 5.000	OD■	+ 7/64, - 0.75% OD
5.500 - 6.625	OD■	+ 1/8, - 0.75% OD
All Sizes	Wall Thickness	- 12.5%
	ID	Governed by OD Tolerances
	Eccentricity OD	.093 Max (Total indicator reading)
	Eccentricity ID	1/16 Max (1/8" Total indicator reading)
	Ovality (On upset)	.093 Maximum

■ Measurements made immediately behind the upset for a distance of approximately 5" for sizes 5.5" OD and smaller, and a distance approximately equal to the OD for sizes larger than 5.5"

* Tool Joint plus drillpipe

■ The tensile strength of the tool joint pin is based on 120,000 PSI yield and the cross sectional area at the root of the thread 5/8 inch from the shoulder

▲ Torsional yield strength based on shear strength of 57.7 percent of the minimum yield strength

◆ p = pin limited yield; b = box limited yield; P or B indicates that tool joint could not meet 80 percent of tube torsion yield

Multiply ft-lb by 1.36 to convert to *Nm*

Data provided by API from Tables 8 and 10 from Figures 1-25, 16th edition, API 7G; August, 1998

* Tool Joint plus drillpipe

■ The tensile strength of the tool joint pin is based on 120,000 psi yield and the cross sectional area at the root of the thread 5/8 inch from from the shoulder

▲Torsional yield strength based on shear strength of 57.7 percent of the minimum yield strength

◆p = pin limited yield; b = box limited yield; P or B indicates that tool joint could not meet 80 percent of tube torsion yield

Multiply ft-lb by 1.36 to convert to *Nm*

Data provided by API from Tables 9 and 10 and from Figures 1-25, 16th edition, API 7G; August, 1998

This table provides data for the drill string. Data are given for the pipe body, tool joint, and drill pipe assembly in Class 1 (new) condition. The tool joint sizes displayed represent common OD and I D configurations, although additional size combinations are available. Grant Prideco offers all API tool joint connections as well as most non-API connections. Custom specifications and special sizes can be provided to meet specific requirements. The technical data are calculated per API RP7G, 16th edition, December 1, 1998 and API Spec 5D, 5th edition, April 30, 2002. While every effort has been made to insure the accuracy of the tables herein, this material is presented as a reference guide only. The technical information contained herein should not be construed as a recommendation. Grant Prideco can not assume responsibility for the results obtained through the use of this material. No expressed and implied warranty is intended. *Tong space is 2" longer than standard.

Data provided by Grant Prideco; October, 2005

		5-1/2				18,522					

Note: In each connection size and type group, Torque values apply to all connection types in the group when used with the same drill collar outside collar diameter and bore; I.E., 2-3/8" API IF, API NC26 and 2-7/8" slim hole connections used with 3-1/2" x 1-1/4" drill collars all have the same minimum make-up torque of 4,600 ft-lb and the box is the weaker member.

* Torque figures preceded by an asterisk indicate the box as the weaker member for the corresponding outside diameter (OD) and bore. The pin is the weaker member for all other torque values.

■ Recommended Make-up Torque calculations assume the thorough application to all threads and shoulders of a thread compound which contains either 40 - 60 percent by weight finely powdered metallic Zinc or 60 percent by weight finely powdered metallic Lead and never more than 0.3 percent Sulfur. Calculations also assume use of the Modified Jack Screw Formula contained in API RP7G, Appendix A, Paragraph A.8, and a Unit Stress of 62,500 psi in the box or pin, whichever is weaker.

❖Normal torque range is tabulated value plus 10 percent. Higher values may be used under extreme conditions.

▲Make-up torque for H-90 based on 56,200 psi stress and other factors in 1, above

● Make-up torque for 2-7/8" PAC based on 87,500 psi stress and other factors in 1, above

Data provided by API, from Table 14, pages 35-38, 16th edition, API RP7G; August, 1998

12	-	-	379	377	374	371	368	364	361	357	352	347	342

Note 1: To determine weights of standard drill collars not shown use the following formula:
(Area OD - Area ID) x 3.408 = wt/ft

Note 2: To determine approximate weights of spiral drill collars, find the pounds per foot for a collar of the same size in the above chart and multiply by 96 percent; for example, a collar with an OD of 6" and an ID of 2" OD = 85 pounds per foot above; 85 x .96 = 81.6 pounds per foot (an approximation)

Note 3: To determine class weights, multiply by number of feet; for example, a 30" class collar with an OD of 6" and an ID of 2" weighs 85 pounds per foot; 85 x 30 = 2,550 pounds

Data provided by API, from Table 13, page 34, 16th edition, API RP7G; August, 1998

See API Specification 7, Table 13 for API standard drill collar dimensions

For special configurations of drill collars, consult manufacturer for reduction in weight

Section 4 - Stretch Data
Table Of Contents

Tubing, Drill Pipe, and Casing Stretch Data

The stretch or elongation of oil well tubular material resulting from an applied pulling force is a commonly required determination. Robert Hooke (1635-1702), discovered the law (Hooke's Law) that strain or distortion is proportional to stress or force if the elastic limit of the material is not exceeded. (The elastic limit of a material is the maximum stress that can be developed within it without causing permanent deformation, or permanent stretch in oil field terms.)

The amount of stretch that will occur when a pull force is applied varies with the amount of pull, the length of material being stretched, the elasticity of the material, and its cross-sectional area, as given in the general stretch formula that follows, provided the elastic limit is not exceeded.

General Stretch Formula:

$$\Delta L = \frac{F \times L \times 12}{E \times a_s}$$

where ΔL = stretch, in inches

F = pull force, in pounds

L = length, in feet

E = modulus of elasticity, in pounds per square inch (for steel, E = 30,000,000 psi)

a_s = cross-sectional area (wall area or OD area minus ID area for tubular material), in square inches

NOTE: It is a common misconception that the rate of stretch for oil field tubular material also is affected by the grade of steel (J-55, N-80, etc.). This is not true.

Higher grades of steel have greater elastic limits and can therefore be stretched farther before reaching their elastic limits than can the lower grades, but the rate of stretch is the same for all grades. The only factors that affect the rate of stretch are those shown in the preceding general stretch formula.

Stretch Tables:

Stretch tables in this section (Pages 4-3 through 4-6) cover a wide range of sizes and weights of tubing, drill pipe, and casing.

Columnar tabulations in the tables show outside diameter weight per foot, inside diameter, pipe wall cross-sectional area, Stretch Constant (SC) and Free Point Constant (FPC).

Determining Stretch:
Amount of stretch is determined by using the correct Stretch Constant from the tables in the following formula:

$$\Delta L = F \times L \times SC$$

where ΔL = stretch, in inches

F = pull force, in thousands of pounds

L = length, in thousands of feet

SC = charted Stretch Constant, in inches of stretch per thousand pounds of pull per thousand feet of length

Example:
Determine the amount of stretch for 30,000 pounds of pull on 6,500 feet of 2.375 OD, 4.7 lb/ft, 1.995 ID tubing.

$$\Delta L = F \times L \times SC$$
$$= 30 \times 6.5 \times 0.30675$$
$$= 59.8 \text{ inches of stretch}$$

Determining Free Point:
The charted Free Point Constant makes it possible to determine very easily the length of pipe being stretched, commonly referred to as determining the free point in a string of stuck or anchored pipe, when the amount of pull force and amount of stretch are known. Read the correct Free Point Constant from the chart for the pipe involved, and use in the following formula:

$$L = \frac{\Delta L \times FPC}{F}$$

where: L = *minimum length of free pipe, or length being stretched, in feet.

ΔL = stretch, in inches

F = pull force, in thousands of pounds

FPC = charted Free Point Constant

***Because of friction forces, which cannot be determined readily, the actual length of free pipe may be longer than calculated. The formula necessarily assumes complete absence of friction.**

Example:
Determine the minimum length of free pipe being stretched when a string of 4-1/2 OD, 16.60 lb/ft drill pipe stretches 18.6 inches with an applied pull of 25,000 pounds.

$$L = (\Delta L \times FPC \times 1{,}000)/F$$

$$= \frac{18.6 \times 11{,}017.5}{25}$$

= 8,197 feet, or approximately 8,200 feet

Calculation of Stretch Constants and Free Point Constants:

For any pipe sizes not included in the tabulated stretch chart data, Stretch Constants and Free Point Constants can be calculated as follows:

$$SC = \frac{0.4}{a_s}$$

$$FPC = 2{,}500 \times a_s$$

where: a_s = pipe wall cross-sectional area, in square inches

Example:
Determine the Stretch Constant for 2.375 OD, 4.7 lb/ft tubing which has a pipe wall cross-sectional area (a_s) of 1.304 square inches.

$$SC = \frac{0.4}{a_s}$$

$$= \frac{0.4}{1.304}$$

= 0.30675

Example:
Determine the Free Point Constant for 4-1/2 OD, 16.60 lb/ft drill pipe which has a pipe wall cross-sectional area (a_s) of 4.407 square inches.

$$FPC = 2{,}500 \times a_s$$

$$= 2{,}500 \times 4.407$$

= 11,017.5

Stretch Graphs:

Stretch graphs are included in this section (Pages 4-7 through 4-12) for 1.660 through 7 OD external upset or non-upset API tubing in the most common weight and wall thickness for each size. For tubing having any other cross-sectional wall area, stretch must be determined from the general stretch formula or from the stretch charts also included in this section.

Each stretch graph involves only three variables: amount of pull force, depth (or length), and amount of stretch. When any two of the variables are known, the third can be read directly from the graph as follows:

1. If **depth** and **pull force** are known, the amount of stretch can be found.
2. If **depth** and **stretch** are known, the amount of pull can be found.
3. If **pull force** and **stretch** are known, the depth or length of tubing being stretched can be found.

Set-Down and Slack Off Weights

When a string of tubing is lowered to put weight on bottom, as in setting a packer, the tubing buckles in the form of a helix and a significant amount of the applied weight is supported by friction between the tubing and casing. The accompanying slack off graphs (Pages 4-13 through 4-18) indicate the magnitude of the effect of friction and provide a means of determining the approximate amount of weight applied on bottom as the tubing is lowered and the weight loss is measured at the surface. Graphs are provided for most common tubing/casing combinations. The graphs were developed from mathematical calculations using an assumed average value for the coefficient of friction. They are presented for information and may not be exactly accurate for any specific case because of the possibility that the coefficient of friction actually involved may vary from the assumed value; however, actual tests run in a variety of well fluids indicate that variations are relatively small.

In situations where the amount of effective tubing weight on bottom may be marginal or inadequate to completely pack off a set-down type packer, it is suggested that an attempt be made to pressure the casing. Pressure in the casing/tubing annulus tends to straighten the tubing and put more weight on the packer. Casing pressure will also increase the pack off force in the packing element of a partially packed off set-down type packer.

Tubing Range Lengths

	Range 1 (ft)	Range 2 (ft)	Range 3 (ft)
Total Range Length, Inclusive	20-24●	28-32■	38-42⬧
Range Length for 100% of Carload*			
Permissible Variation, Maximum	2	2	2

* Carload tolerances shall not apply to order items of less than 40,000 lb of pipe. For any carload of 40,000 lb or more of pipe that is shipped to the final destination without transfer or removal from the car, the tolerance shall apply to each car. For any order item consisting of more than 40,000 lb of pipe that is shipped from the manufacturer's facility by rail, but not to the final destination, the carload tolerance shall apply to the overall quantity of pipe shipped on the order item, but not to the individual carloads.

● By agreement between purchaser and manufacturer the maximum length may be increased to 28.0 ft

■ By agreement between purchaser and manufacturer the maximum length may be increased to 34.0 ft

⬧ By agreement between purchaser and manufacturer, the maximum length may be increased to 45.0 ft

Data provided by API from table E. 30, API 5CT, eighth edition; July, 2005

Casing Range Lengths

	Range 1 (ft)	Range 2 (ft)	Range 3 (ft)
Total Range Length, Inclusive	16-25	25-34	34-48
Range Length for 95 Percent or More of Carload*			
Permissible Variation, Maximum	6	5	6
Permissible Length, Minimum	18	28	36

***** Carload tolerances shall not apply to order items of less than 40,000 lb of pipe. For any carload of 40,000 lb or more of pipe that is shipped to the final destination without transfer or removal from the car, the tolerance shall apply to each car. For any order item consisting of more than 40,000 lb of pipe that is shipped from the manufacturer's facility by rail, but not to the final destination, the carload tolerance shall apply to the overall quantity of pipe shipped on the order item, but not to the individual carloads.

Recommended Tubing Joint Make-up Torque

Values shown are applicable to standard couplings with standard box OD and are based on use of an API modified-type thread lubricant, according to API Bulletin 5A2. Other thread lubricants might require correction factors for make-up torque. Contact manufacturers of premium threads for their recommendations.

Tubing Makeup Torque Guidelines - Round Thread Tubing

It is recommended that the makeup target be based on position, not torque per API 5C1

Under normal circumstances, variations in the listed torque values of +/-25% should be considered acceptable

Data provided by API from table 3, API 5C1, eighteenth edition; May, 1999

* Some joint strengths listed are greater than the corresponding pipe body yield strength listed in the Body Yield Strength column

■ Collapse resistance values calculated by elastic formula

● Minimum internal yield pressure is the lowest of the internal yield pressure of the pipe or the internal yield pressure of the coupling.
The pressure leak resistance at the E1 or E7 plane is the lowest of the internal yield pressure at minimum yield. Leak resistance is as follows: For J-55 and K-55 casing the next higher grade is L-80, For N-80 casing the next higher grades is P-110, for P-110 casing the next higher grade is Q125, no higher grades have been established for other grades

Data provided by API from table 1, API 5C1, eighteenth edition; May, 1999

Notes: 1. It is recommended that the makeup target be based on position, not torque

2. Under normal circumstances, and for sizes 13-3/8 and smaller, variations in the listed torque values of ±25 percent should be considered acceptable

9-7/8	62.80	14,500	16,000	16,000	18,000	20,000

Many factors influence torque application. To ensure minimum torque is attained, HYDRIL recommends a field target make-up torque (optimum torque) 10% over minimum. Maximum recommended make-up torque is 20% over minimum make-up torque. Data provided by HYDRIL Company LP; MAC II Efficiency and Torque Values; October, 2005

Many factors affect torque application. A field target torque (optimum torque) mid-way between minimum and maximum is recommended
Data provided by HYDRIL Company LP; SuPreme LX Efficiency And Torque Values; October, 2005

The minimum makeup torque values apply to all grades of steel. Many factors influence torque application. To ensure that minimum torque is attained, a field target torque (optimum torque) 15% over minimum is recommended. An appropriate safety factor should be applied to these yield torque values. Data provided by HYDRIL Company LP; 563 Casing Efficiency and Torque Values; October, 2005

The minimum, field target, and buck-on torque values apply to all grades of steel. The appropriate safety factor should be applied to these yield torque values. Data provided by HYDRIL Company LP; Type 563 Tubing Torque Values; October, 2005

Dope Quantity for Make-up For VAM SLIJ-II

Nominal OD	Nominal Weight	Minimum Dope Volume		Maximum Dope Volume	
in.	lb/ft	cm^3	$in.^3$	cm^3	$in.^3$
9-7/8	-	34	2.07	45	2.75
10	-	-	-	-	-
10-3/4	less than or equal to 60.70	-	-	-	-
	65.7 to 79.2				
	greater than 79.2				
11-3/4	less than or equal to 65.0	34	2.07	50	3.05
	71.0 to 78.8	-	-	-	-
	greater than 78.8				
11-7/8	-	39	2.38	54	3.30
12-1/16	-	-	-	-	-
12-1/8	-	-	-	-	-
13-3/8	less than or equal to 80.7	-	-	-	-
	greater than 80.7				
13-5/8	-	-	-	-	-

The weight of dope to apply on a connection depends of the specific gravity of the used dope
For example, the make up dope quantity in 7" 35# will be:
18*1.89 = 34g as minimum and 24*1.89 = 45g as maximum with a dope having a gravity of 1.89 g/cm^3 or
1.10*1.10 =1.21 oz as minimum and 1.46*1.10 = 1.61 oz as maximum with a dope having a gravity of 1.10 oz/in^3
Information provided by Vallourec & Mannesmann Tubes, December 5, 2003

ACT Joining System

Threaded and Coupled

Integral Joint

API Threads (EUE 10rd, EUE 8rd, OD 8rd)

- Advanced composite thread (Patents Nos. 4,999,389 and 5,179, 140)
- Precision molded with epoxy, graphite and ceramic
- Tighter tolerances than steel
- Improved make and break properties
- Minimizes thread and wrench damage
- Provides higher thread shear than cut or ground threads
- Chemical resistant threads
- Compatible with steel API threads

* Ratings - all ratings are maximum operating limits. Exceeding these limits will void the warranty of all Star pipe

■ Ultimates - The typical mode of failure for pressure is weep and for tensile it is an across the joint pipe body shear

▲Collars - Smaller OD collars are available upon request, subject to application approval. Any order for integral joint products may include up to 15% threaded and coupled pipe

● Threads - All 1-1/2 EUE 10rd and 2_" - 4-1/2" EUE 8rd API threads conform to API 5B Table 14 (L4 is minimum), and all 5-1/2 - 9_" OD 8rd casing threads conform to API 5B, Table 7 (L4 is minimum).

◆ Elevators T&C - The 1,000 and 15,000 psi have a smaller OD, which may work with the same size elevators as the thread size

- Elevators IF - The setting plates must be removed so that the slips will properly set on the fiber glass pipe. Star IF tubing does not have an upset on the female end. Sizing slip type elevators requires use of the tubing OD instead of the upset OD on the male end. Rubber setting plates are available to minimize marking and to improve the fit. Shorter bolts are required to hold slips in place

⊗ Floor Slips - When running lighter weight (1,000 - 15,000 psi) products, it is good practice to replace the slip dies to make sure they will latch on the pipe body

API Threads (Continued)

Note: CENTRON® Tubing can be used in many applications to 180°F and in some cases above. In all applications, chemical compatibility must be established and physical capabilities of the tubing for the expected conditions must be determined. Contact Centron International Inc. for technical assistance. Ultimate properties listed are at 75°F.

* Quasi-Steady
■ Unrestrained across the joint strength
▲ Not available in 10RD thread
● Not available in 8RD thread

* Pipe weight is based on Threaded and Coupled (T&C) Joining System

NOTES: Ratings - All ratings are maximum operating limits. Exceeding these limits will void the warranty on all Fiber Glass Systems pipe. Ultimates - The typical mode of failure for pressure is weep and for tensile it is an across the joint body sheer. Collars - Smaller OD collars are available upon request, subject to application approval. Any order for integral joint products may include up to 15% threaded and coupled pipe. Threads - All 5-1/2" - 9-5/8" OD 8rd casing threads conform to API 5B, table 7 (L4 is minimum). Thermal Properties - Coefficient of thermal conductivity 0.2 BTU/(ft hr ºF0 3,0 cal./*(cm hr ºC)*; Coefficient of thermal expansion 8.7 x 10-6 in./in./ºF *(15,7 x 10-6 mm/mm/ºC)* Flow Factors - Hasen Williams C-150; Effective Roughness = 0.00006 in. *(1524 x 10-6 mm)*
Physical Properties - Density (lb/cu ft) - 122; Density *(kgs/cu cm)* = 1,96 x 10-3; Specific gravity = 1.96

STAR™ Fiber Glass Downhole Tubing/Casing Product Data

Product Description

- Pressure - Up to 4,000 psi *(27.6 MPa)*
- Resin System - Aliphatic Amine Cured Epoxy
- Reinforcement - Premium Fiber Glass
- Joining System - API 8rd, Threaded and Coupled or Integral Joint
- Joint Length - 30 Feet *(9.1 Meters)* Nominal, API Range 2, 28 to 32 Feet *(8.5 to 9.8 Meters)*
- Fittings - A variety of filament wound API Threaded Nipples, Couplings and Swages
- Temperature - Up to 200ºF *(93.3ºC)* Maximum
- Sizes - 1-1/2 through 9-5/8 Inches

Tubing Design

- Non API
- Design Temperature - Up to 200ºF *(93.3ºC)*
- Wall Thickness – Nominal
- Design - Based on the Proportional Elastic Limit on both the Hoop and Axial direction
- 100% Factory Hydrotest - All sizes to 1.25 x Pressure Rating
- Tensile Test - since the hydrotest is across the joint and unsupported, tensile loads of a proportional amount are generated

Benefits

- Controls Corrosion Caused by CO_2, H_2S and Salt Water
- Improved Flow Efficiency
- Easily Drilled Up
- Excellent Logging Characteristics

Applications

- Disposal or Injection Tubing to Depths of 10,000 Feet
- Production Tubing - ESP, Gas Lift, or Rod Pump
- Casing Liners - Cemented and Perforated, Zone, or to Surface
- Chemical Waste Disposal
- Geothermal
- Slotted Production Liners and Prepacked Screens
- Observation Well Casing
- Openhole Casing, Zone, or To Surface

Physical Properties

- Density (lb/cu ft) = 122
- Density *(kgs/cu cm) = 1,96 x 10^{-3}*
- Specific Gravity = 1.96

Thermal Properties

- Coefficient of Thermal conductivity 0.2 BTU/(ft. hr. ºF) *3,0 cal. (cm.hrºC)*
- Coefficient of Thermal Expansion 8.7 x 10-6 in./in./ºF *(15, 7 x 10^{-6} mm/mm/ºC)*

Flow Factors

- Hazen Williams C = 150
- Effective roughness = 0.00006 inches *(1524 x 10^{-6} mm)*

Nominal Moduli

- Modules of Elasticity Hoop - 4.5 psi x 10^6 *(GPa 31.1)*, Axial - 3.0 psi x 10^6 *(GPa 20.7)*
- Poisson's Ratio (Minor) = 0.25

NOTE: Pipe weight is based on Threaded and Coupled (T&C) joining system

NOTES: 1. Ratings - All ratings are maximum operating limits. Exceeding these limits will void the warranty on all Fiber Glass Systems pipe.
2. Ultimates - The typical mode of failure for pressure is weep and for tensile it is an across the joint body shear.
3. Collars - Small OD collars are available upon request, subject to application approval. Any order for integral joint products may include up to 15% threaded and coupled pipe.
4. Threads - All 1 1/2" EUE 10rd and 2-3/8":-4 1/2" EUE 8rd API threads conform to API 5B, table 14 (L4 is minimum).

Data provided by STAR™ Aliphatic Tubing; Fiber Glass Systems L.P., Manufacturers - San Antonio, TX; September 2005

STAR™ Fiber Glass General Information

Packer Selection

- STAR™ tubing is designed to be set in tension (see stretch chart).
- Double Grip Packers are preferred with an on/off tool seal assembly, 1/4 turn release.
- Direct Tension Set Packers should be avoided due to the movement of fiber glass.
- Direct Set Packers are run < 3,500 feet deep *(1,067 m)*.
- Set Packers with a steel work string > 3,500 feet deep *(1,067 m)*.
- Hydraulic Set Packers are not recommended, due to uncontrollable forces.
- Polished Bore Receptacles are run with proper precautions to avoid compression.
  A complete STAR™ Well Evaluation must be run to determine the proper set-ups.

Perforation

- Use a Jet Perforating gun. Shoot a maximum of two shots at a time at 0° Phase or 180° Phase.
- Mechanically decentralized.
- Two (2) to four (4) shots per foot maximum.
- Steel, Hollow Carrier, ten (10) to sixteen (16) gram selected fire charges.
- Interval acidizing with 15% to 25% Hydrochloric Acid is common practice for up to four (4) hours maximum.
  Displace with five (5) times the tubing volume.

Cementing

- Standard float equipment, check thread compatibility.
- Thread lock all steel to FRP connections.
- When installing mixed strings, have one joint of FRP casing supplied without a coupling (pin x pin) for cross-overs.
- Cementing in two stages may help avoid exceeding collapse rating.
- Keep differential below external and internal rating at all times.
- Care must be given to avoid shock collapse pressure when setting cement plug.
- Fiber Glass centralizers are available; metal centralizers must be qualified to fit to FRP.
- Cement residue can be cleaned up with proper care using a rock bit.
- Landing joints are available, but must be sized for the well-head selected.
- Drilling-Up fiber glass tubing or casing is easy with a rock bit (not a mill).

Rod Pump Wells

- It is preferred that the tubing be anchored

Electrical Submersible Pumps

- Care must be given to direction and amount of start-up torque.
- Anchoring is good practice

Fishing

- Normal Procedures, Spear or Overshot

Cutting

- Mechanical Jet Cutter

Section 6 - Dimensions and Capacities

Table Of Contents

Equations for Calculating Volume and Height Between: Tubing/Casing and Hole; Tubing/Casing and Casing*

Cubic feet per lineal foot = $.005454 \times (D^2 - d^2)$

Lineal feet per cubic foot = $183.35 / (D^2 - d^2)$

Gallons per lineal foot = $.0408 \times (D^2 - d^2)$

Lineal feet per gallon = $24.51 / (D^2 - d^2)$

Barrels per lineal foot = $.0009714 \times (D^2 - d^2)$

Lineal feet per barrel = $1029.4 / (D^2 - d^2)$

D = inside diameter in inches for pipe; hole diameter in inches for holes

---

The following notes apply to the tables within this section:

- ■ Ft/Cu Ft = $\frac{1}{\text{Cu Ft/Ft}}$
- ● m/m^3 = $\frac{1}{\text{m}^3/\text{m}}$
- ▲ Ft/Bbl = $\frac{1}{\text{Bbl/Ft}}$
- ◆ Ft/Gal = $\frac{1}{\text{Gal/Ft}}$

No allowance made for Couplings or Tool Joints

■ cu ft per lin ft = $\frac{\text{gal per lin ft}}{7.48}$

■ bbl per lin ft = $\frac{\text{gal per lin}}{\text{ft}}$

● m^3 per lin ft = $\frac{\text{L per lin ft}}{1{,}000}$

Section 7 - Annular Volume Tubing
Table Of Contents

Annular Volume Between Tubing and Casing or Open Hole

Annular Volume Between Drill Pipe and Casing or Open Hole

NOTE: The following annular tables contain some combinations of tubing and casing that will not go together with standard couplings. These combinations are for use with flush joint pipe being the inside pipe of the combination.

Equations for Calculating Volume and Height Between: Tubing/Casing and Hole; Tubing/Casing and Casing*

Cubic feet per lineal foot = $.005454 \times (D^2 - d^2)$

Lineal feet per cubic foot = $183.35 / (D^2 - d^2)$

Gallons per lineal foot = $.0408 \times (D^2 - d^2)$

Lineal feet per gallon = $24.51 / (D^2 - d^2)$

Barrels per lineal foot = $.0009714 \times (D^2 - d^2)$

Lineal feet per barrel = $1029.4 / (D^2 - d^2)$

Where:

For volume and height between tubing and hole:
- D = diameter of hole, inches
- d = outside diameter of tubing, inches

For volume and height between casing and hole:
- D = diameter of hole, inches
- d = outside diameter of casing, inches

For volume and height between tubing and casing:
- D = inside diameter of casing, inches
- d = outside diameter of tubing, inches

For volume and height between casings:
- D = inside diameter of outer casing, inches
- d = outside diameter of inner casing, inches

For volume and height between multiple tubing strings and hole (or casing):
- D = diameter of hole, inches (or ID of casing)
- d = outside diameter of tubing, inches

*For multiple strings of tubing/casing, multiply d by number of strings

---

The following notes apply to the tables within this section:

■ Ft/Cu Ft = $\frac{1}{\text{Cu Ft/Ft}}$ ▲ Ft/Bbl = $\frac{1}{\text{Bbl/Ft}}$ ● $m/m^3 = \frac{1}{m^3/m}$

Gal/Ft = CuFt/Ft x 7.48

OH = Open Hole

Section 8 - Annular Volume Casing
Table Of Contents

Annular Volume Between Casing and Casing or Openhole

Equations for Calculating Volume and Height Between: Tubing/Casing and Hole; Tubing/Casing and Casing*

Cubic feet per lineal foot = $.005454 \times (D^2 - d^2)$

Lineal feet per cubic foot = $183.35 / (D^2 - d^2)$

Gallons per lineal foot = $.0408 \times (D^2 - d^2)$

Lineal feet per gallon = $24.51 / (D^2 - d^2)$

Barrels per lineal foot = $.0009714 \times (D^2 - d^2)$

Lineal feet per barrel = $1029.4 / (D^2 - d^2)$

Where:

For volume and height between tubing and hole:
- D = diameter of hole, inches
- d = outside diameter of tubing, inches

For volume and height between casing and hole:
- D = diameter of hole, inches
- d = outside diameter of casing, inches

For volume and height between tubing and casing:
- D = inside diameter of casing, inches
- d = outside diameter of tubing, inches

For volume and height between casings:
- D = inside diameter of outer casing, inches
- d = outside diameter of inner casing, inches

For volume and height between multiple tubing strings and hole (or casing):
- D = diameter of hole, inches (or ID of casing)
- d = outside diameter of tubing, inches

*For multiple strings of tubing/casing, multiply d by number of strings

---

The following notes apply to the tables within this section:

■ Ft/Cu Ft = $\frac{1}{\text{Cu Ft/Ft}}$ ▲ Ft/Bbl = $\frac{1}{\text{Bbl/Ft}}$ ● $m/m^3 = \frac{1}{m^3/m}$

Gal/Ft = CuFt/Ft x 7.48

OH = Open Hole

Annular Volume Between Casing and Casing or Openhole

API Specifications for Gravel Pack Sand

Sieve Analysis	A minimum of 96 percent by weight of the tested sand sample should pass the course designated sieve and be retained on the fine designated sieve (with the course and fine designated sieves defined in the table below). Not over 0.1 percent of the total tested sample should be retained by the course designated sieve and not over 2 percent of the total tested sample pass through the fine designated sieve.
Sphericity and Roundness	Gravel pack sand should have an average sphericity of 0.6 or greater and an average roundness of 0.6 or greater as determined by visual analysis using the chart developed by Krumbein and Sloss.
Acid Solubility	A 5 gram sand sample is added to *100 ml* of 12 percent -3 percent HCl-HF acid and allowed to sit for one hour at 72°F to allow dissolution of contaminates (carbonates, feldspars, iron oxides, clays, etc.). The sand is then removed and dried. The before and after weights are compared to determine acid solubility. The acid soluble material in gravel pack sand should not exceed 1.0 percent by weight.
Silt and Clay Content	A *20 ml* sample of dry sand is mixed with *100 ml* of demineralized water and allowed to sit for thirty minutes. The sample is then shaken vigorously for 30 seconds and allowed to sit for 5 minutes. A *25 ml* sample of the water-silt suspension is removed and the turbidity is measured. The resulting turbidity of tested gravel pack sand should be 250 NTU's or less.
Crush Resistance	A sample is sieved to remove all fines and weighed. The sample is then exposed to 2,000 psi confining stress for two minutes. The sample is sieved again to determine the weight of fines generated. Gravel pack sand subjected to this test should not produce more than 2 percent by weight fines. For large sand sizes, 12-20 U.S. Mesh and 8-16 U.S. Mesh, the amount of fines produced should not exceed 4 percent and 8 percent respectively.

Data provided by API, from Recommended Practice 58 (RP58), "Recommended Practices for the Testing of Sand Used in Gravel Pack Operations," First Edition; March 31, 1986

Gravel and Screen Sizing Guidelines

Sorting Coefficient

- $C_\mu = d_{40}/d_{90}$
- $C_\mu < 3$, uniform
- $3 \leq C_\mu \leq 5$, non-uniform
- $C_\mu > 5$, highly non-uniform

Gravel Pack Sand Sizing

- Use $D_{50} \leq 6 \times d_{50}$
- If highly non-uniform ($C_\mu > 5$) consider using next smaller size

Wire Wrapped Screen Gauge

- When used with a gravel pack, screen opening should be ±70 percent of the smallest grain diameter of selected gravel pack sand.
- When used in a standalone application, screen opening should be sized to the d10 of the formation sand size, if possible.

EXCLUDER™ Screen Sizing

- $d_{10} < 100$ microns, use prepacked screen
- 100 microns $< d_{10} <$ 200 microns, use Fine EXCLUDER2000™
- $200 < d_{10} < 250$, use Medium EXCLUDER2000™
- $d_{10} > 250$, use EXCLUDER2000™ Coarse
- d_{10} equals the dimension of the grain size at the largest 10^{th} percentile by weight (diameter d_{10} > diameter d_{50})

Alternately, use the following criteria:

- $d_{50} < 75$ microns, use prepacked screen
- 75 microns $< d_{50} <$ 150 microns, use 110 EXCLUDER™
- $d_{50} > 150$ microns, use 230 EXCLUDER™

Pore Size Selection Criteria

Size	Formation	Description
Fine	100 p.m.<d_{10}<200 p.m.	High sand retention efficiency
Medium	200 p.m.<d_{10}<300 p.m.	Allows for conditioned mud flow back
Coarse	d_{10}>300 p.m.	Minimum fines plugging and maximum mud flow back capacity

Slurry Calculations

Clean Fluid Volume Required

$$V_f = \frac{G_w}{W_g}$$

Where:

V_f = clean fluid volume required (gal)
G_w = weight of gravel required (lb)
W_g = gravel mix ratio (ppg)

Slurry Volume

$$V_s = V_f(1 + D_{sv}W_g)$$

Where:

V_s = slurry volume (bbl)
V_f = clean fluid volume (bbl)
W_g = gravel mix ratio (ppg)
D_{sv} = specific volume of gravel (gal/lb)

Slurry Density

$$D_s = \frac{D_b + W_g}{1 + D_{sv}W_g}$$

Where:

D_s = slurry density (ppg)
D_b = base fluid density (ppg)
W_g = gravel mix ratio (ppg)
D_{sv} = specific volume of gravel (gal/lb)

Sand Feed Rate

$$Q_g = \frac{42Q_s}{\left(\frac{1}{W_g} + D_{sv}\right)}$$

Where:

Q_s = slurry rate (bbl/min)
Q_g = sand rate (lb/min)
W_g = gravel mix ratio (ppg)
D_{sv} = specific volume of gravel (gal/lb)

Gravel Mix Ratio

$$W_g = \frac{Q_g}{42Q_s - D_{sv}Q_g}$$

Where:

Q_s = slurry rate (bbl/min)
Q_g = sand rate (lb/min)
W_g = gravel mix ratio (ppg)
D_{sv} = specific volume of gravel (gal/lb)

Settling Factor

$$SF = \frac{W_g(D_{bv})}{1 + D_{sv}(W_g)} \times 100$$

Where:

SF = settling factor (%)
W_g = gravel mix ratio (ppg)
D_{bv} = bulk volume (gal/lb) = 7.48/bulk density (lb/cu ft)
D_{sv} = specific volume of gravel (gal/lb) = 1/particle density

Sand Feed Rate < 1 - 10 > (lb/min)

Darcy's Law Equations For Water Pack

Linear Flow (Velocity < 0.7 ft/sec)

$$h = \frac{0.00078\, kA(p_s - p_i)}{\mu q}$$

Where:
- h = gravel height above top of screen (ft)
- k = permeability of gravel (darcies)
- A = flow area in casing/blank annulus (ft^2)
- p_s = sandout pressure (psi)
- p_i = initial circulating pressure (psi)
- μ = completion fluid viscosity (cp)
- q = pump rate (bpm)

Linear Flow (Velocity > 0.7 ft/sec)

$$h = \frac{kA^2(p_s - p_i)}{1279.0\mu qA + 0.0000144\left(\frac{21(1-\phi)}{d_{50}\phi^3}\right)\rho k q^2}$$

Where:
- h = gravel height above top of screen (ft)
- k = permeability of gravel (darcies)
- A = flow area in casing/blank annulus (ft^2)
- p_s = sandout pressure (psi)
- p_i = initial circulating pressure (psi)
- μ = completion fluid viscosity (cp)
- q = pump rate (bpm)
- ϕ = porosity (fraction)
- d_{50} = average grain size (in.)
- ρ = completion fluid density (ppg)

Flow Velocity

$$V = \frac{5.615q}{A}$$

Where:
- V = flow velocity (ft/min)
- A = flow area (ft^2)
- q = pump rate (bpm)

Note:

1. Minimum wall thickness is 0.005" less than specified wall thickness
2. Pressures calculated based on (t-0.005) in
3. Maximum hydrostatic test pressure is 15,000 psi

Data provided by Quality Tubing; October, 2005

Note:

1. Minimum wall thickness is 0.005" less than specified wall thickness
2. Pressures calculated based on (t-0.005) in
3. Maximum hydrostatic test pressure is 15,000 psi

Note:
1. Minimum wall thickness is 0.005" less than specified wall thickness
2. Pressures calculated based on (t-0.005) in
3. Maximum hydrostatic test pressure is 15,000 psi

Note:
1. Minimum wall thickness is 0.005" less than specified wall thickness
2. Pressures calculated based on (t-0.005) in
3. Maximum hydrostatic test pressure is 15,000 psi

					3 SB	3 JDC*

* These dimensions are based on using the pulling tools (overshots) most commonly found on wire line service trucks. They are the Otis® RB, RS, SB, and SS, and the Schlumberger JDC, JUC, JDS, and JUS. The RB, RS, JUC, and JUS are all jar-up release tools, and the others are jar-down release

■ The minimum recommended distance to allow an Otis® SB or Schlumberger JDC pulling tool to release

▲ Fishing Neck Type Size sometimes referred to by “A” dimension

● The least recommended diameter immediately surrounding the fishing neck to allow the overshot dogs room to latch and unlatch

Thru-Tubing Inflatable Element Ratings

Pressure differentials for inflatable devices are slightly more complex than standard mechanical tools. In the mechanical arena the calculation of allowable differential pressures, both in terms of pressure reductions (such as drawdown) or applied pressure (such as testing) is a relatively simple process. The mechanical solution supplies us with a very two dimensional platform on which we have to base our calculations, i.e the difference in pressure from above to below the packing element or the pressure from below to above. When a high expansion fluid filled inflatable type of packing element is introduced into the equation the same thinking in terms of simple hydraulics calculations does not apply. A new third dimension is introduced whereby not only must pressure differentials across the device itself be considered, but also differences in pressure from the inside of the inflatable element to the outside of the element.

Some quick formulas for calculating maximum inflation pressures and maximum available drawdown:

Maximum Element Inflation Pressure =

Element Pressure Rating - (minus) Maximum Required Drawdown

Maximum Allowable Drawdown =

Element Pressure Rating - (minus) Element Inflation Pressure

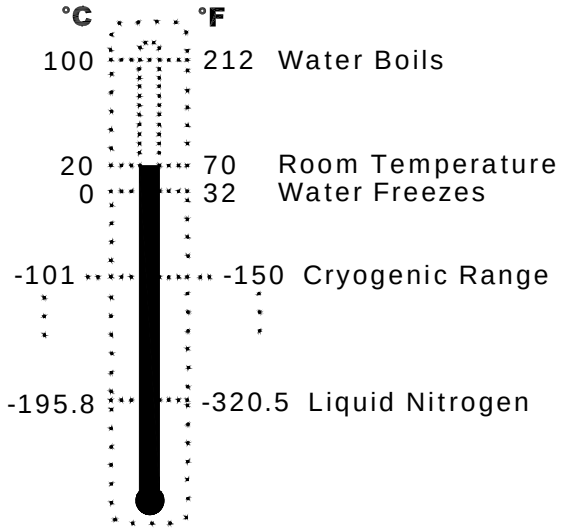
Reduce pressure ratings by 10% for acid service elements and by 20% for H_2S service elements. Standard service elements use high strength alloys but are susceptible to stress corrosion cracking (SCC) in H_2S and other highly corrosive environments. Acid service elements use nickel alloy materials, but the material does not meet requirements of NACE MR0175. H_2S service elements use nickel alloy materials that meet the requirements of NACE MR0175. For element ratings in different ID's from above please contact your local Baker Hughes representative.

Nitrogen Properties and Uses

Nitrogen makes up approximately 78% of the earth's atmosphere. Nitrogen gas is an inert gas that is both colorless and odorless, with a density of 0.0724 pounds/scf (at 14.7 psia and 60°F). In 1959, when techniques for using liquid nitrogen were developed, nitrogen made its introduction into the oilfield. Nitrogen is converted into a liquid (along with oxygen) through a gas separation and liquification plant. The liquid nitrogen (LN_2) is considered a cryogenic material. Cryogenics is a term used for material at -150°F or colder.



Temperature Characteristics

At atmospheric pressure (14.7 psia), liquid nitrogen will boil at -320.5°F.
In other words, it begins to vaporize to a gas above -320.5°F.

LN_2 boiling point = -320.5°F at 14.7 psia.

The critical temperature (where all properties of the coexisting vapor and liquid phases become identical) = -232.8°F.

Volume Characteristics

If you had one gallon of liquid nitrogen (at atmospheric pressure) and allowed it to vaporize entirely into gas, you would then have 93.11 scf (standard cubic feet) of nitrogen gas. Standard conditions are considered to be at 14.7 psi (1 atmosphere) pressure and 70°F.

Conversion tables tell us that one gallon is equal to 0.1337 cubic feet. One gallon of liquid nitrogen is also 0.1337 cubic feet of liquid nitrogen. If it is allowed to entirely vaporize to a gas (at 14.7 psi and 70°F), you would still end up with 93.11 scf of gas. This is equivalent to 696.5 gallons of gas. Remember, 93.11 cf / 0.1337 cf/gallon = 696.5 gallon.

Conversion Data

	1 Lb	1 Kg	1 SCF Gas	1 Nm^3 Gas	1 Gal Liquid	1 L Liquid
lb	1.0000	2.205	0.07245	2.757	6.745	1.782
Kg	0.4536	1.0	0.03286	1.2506	3.060	0.8083
scf gas	13.803	30.42	1.0	38.04	93.11	24.60
Nm^3	0.3627	0.7996	0.02628	1.0	2.447	0.6464
Gal Liquid	0.1481	0.3262	0.01074	0.4080	1.0	0.2642
L Liquid	0.5606	1.2349	0.04065	1.5443	3.785	1.0

* Nm^3 (Normal cubic meter) gas measured at 1 atmosphere and 0°C. All values rounded to nearest 4/5 significant numbers. SCF (standard cubic foot) gas measured at 1 atmosphere and 70°F. Liquid measured at 1 atmosphere and boiling temperature. All values are consistent with standards adopted by the Compressed Gas Association on June 6, 1962

Nitrogen Characteristics

- Chemical Symbol = N_2
- Molecular Weight = 28.016
- Triple Point = -345.9°F at 1.82 psig
- Specific Gravity of Liquid Nitrogen (water = 1.0) = 0.809
- Normal Boiling Point = -320.45°F
- Latent Heat of Evaporation = 85.67 BTU/lb
- Critical Temperature = -232.87°F
- Critical Pressure = 492.3 psia
- Critical Pressure Atmospheres abs. = 33.54
- Triple Point Pressure Atmospheres abs. = 0.1238
- Triple Point Pressure psia = 1.819
- Specific Heat (cp) @77°F = 0.4471 BTU / (lb) (°F)
- Ratio of Specific Heat = 1.4014 @ 70°F
- Coeff Viscosity, Micropoises @ 77°F = 117.96
- Thermal Conductivity @ 60°F = 0.01462 BTU / ft^2/hour
- Density of Saturated Vapor @ 14.7 psia - 0.03635 lb/ft^3
- Density lb/ft^3 70°F 1 ATM = 0.07245
- Specific Gravity of Saturated Vapor @ 14.7 psia (air = 1.0) = 0.967
- Specific Volume cu ft per lb 70°F 1 ATM = 13.803
- Density of Liquid Nitrogen @ Normal Boiling Point 0 = 50.443 lb/ft^3
- Weighs approximately 3% less than air (at atmospheric temperature)
- Odorless, colorless, tasteless
- Nontoxic and nonflammable

Nitrogen Calculations

The density of nitrogen at a given temperature and pressure is:

$$\rho = \frac{MP}{ZRT}$$

Once the constants and unit conversions are included, this equation can be written for standard units as:

$$\rho(scf/bbl) = \frac{198.6P(psia)}{Z(460 + °F)}$$

In metric units, it can be written as:

$$\rho(sm^3/m^3) = \frac{2.8416P(kPa)}{Z(273 + °C)}$$

These densities are the “volume factors” in the following tables. Note that both of these densities express the weight or mass as a “standard” volume. Standard conditions are defined as atmospheric pressure (14.7 psia or 1 atm) and 60°F or *(15°C)*. SCF stands for standard cubic feet and scm or sm^3 stands for standard cubic meters.

The pressure vs depth for a well filled with Nitrogen graphs were based upon a surface temperature of 70°F *(21°C)* and a gradient of 1.6°F per 100 ft *(2.92°C per 100 meters)*. Variations in the well temperature from these values make relatively small changes in the pressures.

The following examples show how the graphs in this section can be used to solve nitrogen problems.

Standard Units - Example 1

How much nitrogen is required to fill a 12,500 ft reel of 2" OD x 0.156" wall CT to 3,500 psia at an average temperature of 75°F?

1. From the Coiled Tubing technical data table earlier in this section, read the internal volume for this size 2.7679 bbl/1,000 ft.
2. Multiply this value by 12.5 thousand feet to obtain a total volume of 34.6 bbls.
3. Using the Volume Factor - Medium pressure graph, read the volume factor as 1,200 SCF/bbl.
4. Multiply the volume of the reel by the volume factor to obtain 41,520 SCF. This is the amount of nitrogen needed.

Metric Units - Example 1

How much nitrogen is required to fill a 3,810 m reel of 50.8 mm OD x 3.962 mm wall CT to 24,100 kPa at an average temperature of 24°C?

1. *From the Coiled Tubing technical data table earlier in this section read the internal volume for this size and convert to metric 1.4438 liters/m, which is the same as 1.4438 m^3/1,000 m.*
2. *Multiply this value by 3.81 thousand meters to obtain a total volume of 5.5 m^3.*
3. *Using the Volume Factor - Medium pressure graph, read the volume factor as 221 scm/m^3.*
4. *Multiply the volume of the reel by the volume factor to obtain 1,215 scm. This is the amount of nitrogen needed.*

Standard Units - Example 2

The same reel of CT as Example 1 (standard) is being used to place nitrogen in a well. The CT will be run to 7,500 ft Nitrogen will be pumped until the pressure at the end of the CT reaches 3,500 psia, filling both the well tubular, which is 3.5" 12.95 lb/ft EU tubing and the CT.

1. From the dimensions and capacities section 6 of this tech facts book, read the internal volume for this size tubing as 7.35 bbls/1,000 ft.
2. Multiply this value by the depth of 7.5 thousand feet to obtain a well volume of 55.125 bbls.
3. From the technical data table earlier in this section, read the internal volume for this coiled tubing size as 2.7679 bbls/ 1,000 ft and the external displacements as 3.8857 bbls/1,000 ft.
4. Multiply these values by 7.5 thousand feet to obtain a internal volume of 20.76 bbls and the external displacement as 29.143 bbls.
5. The total volume in the well to be filled with nitrogen is 55.125 - 29.143 + 20.76 = 46.74 bbls.
6. From the pressure vs depth for a well filled with Nitrogen graph, find the point where the pressure is 3,500 psia at 7,500 ft of depth. Follow the curves upward to read an approximate surface pressure of 2,750 psia.
7. The average pressure is (3,500 + 2,750)/2 = 3,125 psia.
8. The estimated bottom hole temperature is 70°F + 1.6 * 75 hundred feet = 190°F.
   The average temperature is (190 + 70)/2 = 130°F.
9. The Volume Factor for this average temperature and pressure is approximately 950 SCF/bbl.
10. Multiplying this volume factor by the well volume from Step 5 yields a nitrogen requirement of 44,400 SCF.
11. For the remaining 5,000 ft of CT on the reel, assume the pressure will be the same as the wellhead pressure, which is 2,750 psia, and the temperature is 75°F. Using the Volume Factor - Medium Pressure Graph, read the volume factor as 990 SCF/bbl. The volume of this section of the coiled tubing is 2.7679 * 5 thousand feet - 13.84 bbls.
12. Multiply the volume of this section by the volume factor to obtain 13,700 SCF.
13. The total nitrogen required is 13,700 + 44,400 = 58,100 SCF.

Metric Units - Example 2

The same reel of CT as Example 1 (metric) is being used to place nitrogen in a well. The CT will be run to 2,285 m. Nitrogen will be pumped until the pressure at the end of the CT reaches 24,100 kPa, filling both the well tubular, which is 88.9 mm 19.27 kg/m EU tubing and the CT.

1. *From the dimensions and capacities in section 6 of this tech facts book, read the internal volume for this size tubing as 0.0038 m^3/m, which is the same as 3.800 m^3 per 1,000 meters.*
2. *Multiply this value by the depth of 2.285 thousand meters to obtain a well volume of 8.683 m^3.*
3. *From the technical data table earlier in this section read the internal volume for this size and convert to metric 1.4438 liters/m and the external displacement as 2.0268 liters/m.*
4. *Multiply these values by 2.285 thousand meters to obtain a internal volume of 3.3 m^3 and the external displacement as 4.631 m^3.*
5. *The total volume in the well to be filled with nitrogen is 8.683 - 4.631 + 3.3 = 7.352 m^3.*
6. *From the Pressure vs Depth for a Well Filled with Nitrogen graph, find the point where the pressure is 24,100 kPa at 2,285 m of depth. Follow the curves upward to read an approximate surface pressure of approximately 19,000 kPa.*
7. *The average pressure is (24,100 + 19,000)/2 = 21,550 kPa.*
8. *The estimated bottom hole temperature is 21°C + 2.92 * 22.85 hundred meters = 88°C. The average temperature is (88 + 21)/2 = 55°C.*
9. *The Volume Factor for this average temperature and pressure is approximately 170 sm^3/m^3.*
10. *Multiplying this volume factor by the well volume from Step 5 yields a nitrogen requirement of 1,250 sm^3.*
11. *For the remaining 1,525 m of CT on the reel, assume the pressure will be the same as the wellhead pressure, which is 1,900 kPa, and the temperature is 24°C. Using the Volume Factor - Medium Pressure graph, read the volume factor as 175 sm^3/m^3. The volume of this section of the coiled tubing is 1.4438 * 1.525 thousand meters = 2.2 sm^3/m^3.*
12. *Multiply the volume of this section by the volume factor to obtain 385 sm^3.*
13. *The total nitrogen required is 385 + 1,250 = 1,635 sm^3.*

Nomenclature

M = molecular weight of Nitrogen = 28.0134

P = absolute pressure (psi for English units, *kPa* for metric units)

R = gas constant (1545 ft-lb/lb mole °R - for English units, 0.08206 atm-liters/gm mole °K)

T = absolute temperature (°F + 460 for English units, °C + 273 for metric units)

Z = compressibility factor for the following Nitrogen Compressibility Factor curves

ρ = density in weight or standard volume per unit volume

Section 11 - General Information
Table Of Contents

Multilateral Systems

Baker Hughes Multilateral Systems

- Mechanical support at the junction for TAML levels 3 to 6
- Selective mainbore and lateral access capability
- Compatible with conventional or intelligent well systems
- Flexible production options utilizing:
  - Selective re-entry tool
  - Dual completion module
  - Dual seal module
  - Lateral entry module
  - Lateral entry nipple

FORMation Junction™

- Reformable drilling junction allows for larger production casing downhole
- Extended length of casing below leg #1 provides for greater lateral separation
- Well control maintained during installation
- Lateral open-hole completions include:
  - Perforated or slotted liners
  - Sand screens
  - Gravel pack systems
  - Expandable screens and liners
- New well applications

HOOK Hanger™-L5

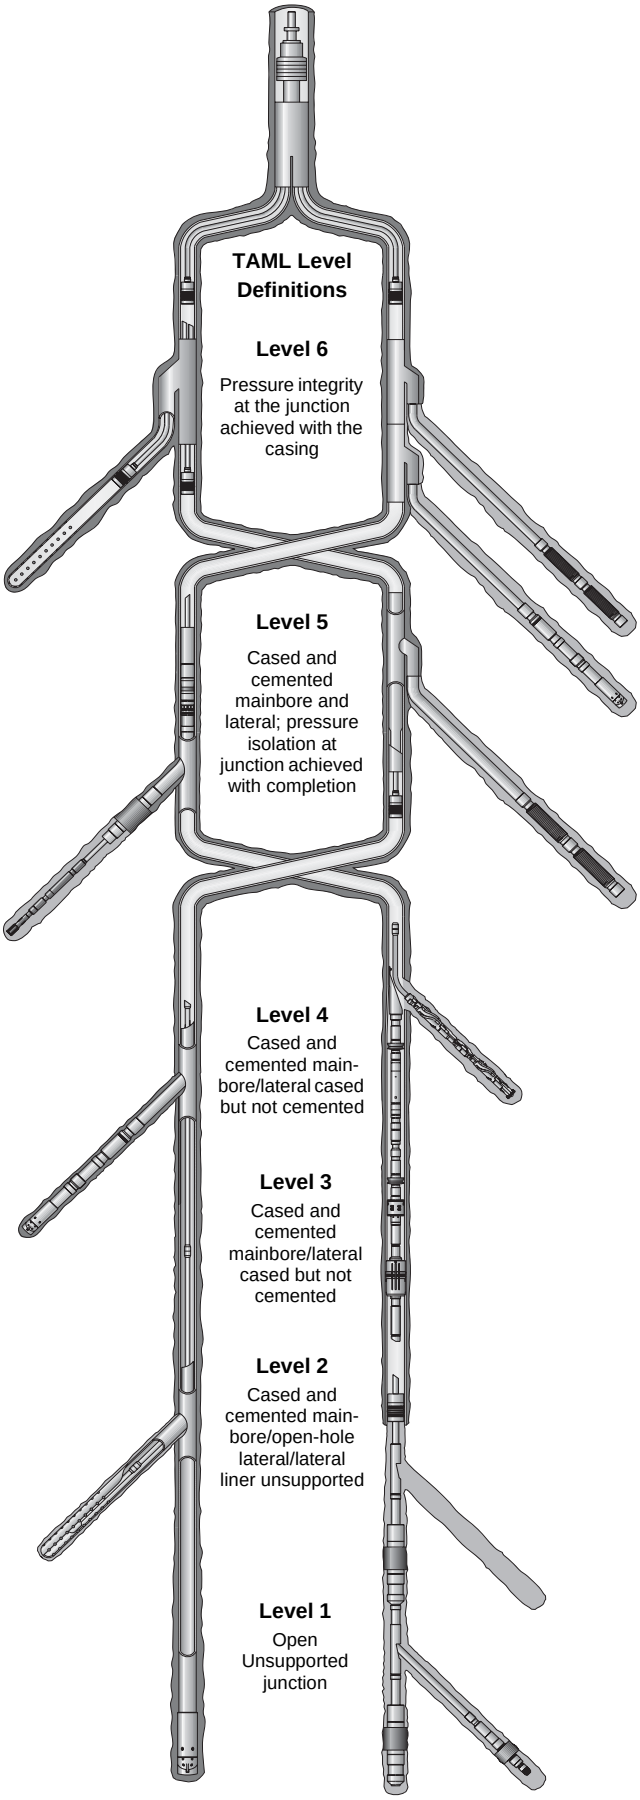
- All the features of a Level 3 and 4 plus:
  - Hydraulic isolation provided with a tubing straddle assembly at the junction

HOOK Hanger™-L4

- All the features of a level 3 HOOK Hanger™, plus HOOK Hanger is cemented back into the mainbore providing additional mechanical support
- Liner wash over is not required at the junction, eliminating debris

HOOK Hanger™-L3

- Lateral liner, screens, expandable systems installed with system in a single trip
- Multiple HOOK Hangers can be stacked in the wellbore for maximum reservoir contact
- Selective access to all laterals in a single or stacked application
- Extended reach drilling capability
- Fracturing applications compatible
- New or re-entry well applications



DeepSet Splitter™

- High burst and collapse ratings
- Junction enables the drilling of two wellbores
- Riser/diverter system for conventional drilling, liner installation, and cementing operations
- New well applications

Stackable Splitter™

- Junction system for high pressure applications
- Single or multiple splitters are installed and cemented with a single casing string
- Pressure isolating diverter system for selective fracturing or other high pressure applications
- New well applications

FORM 5™ Junction™

- Reformable completion system provides maximum lateral production
- Lateral open-hole completions include:
  - Perforated or slotted liners
  - Sand screens
  - Gravel pack systems
- CRA material option
- New or re-entry well applications

SLOPE™ System

- Permanent datum point and orientation point for:
  - Casing exit
  - Selective lateral access
- Multiple nipples can be installed in a single casing string
- Casing orientation not required prior to cementing
- Casing pressure integrity and full bore ID maintained
- New well applications

Open-Hole Multilateral System

- Construct accurate open-hole sidetracks
- Positive through tubing re-entry access to all laterals
- Lateral production control and isolation

■ Buoyancy factor is used to compensate for loss of weight when steel tubulars are immersed in fluid

Applicable only when tubing or casing is completely filled with fluid

Actual hook load = length of string (ft) x weight of string (lb/ft) x Buoyancy Factor

Tubing Movement Formulas

Changes in temperature and pressure cause contraction or expansion of a tubing string as covered in detail within Baker's "Packer Calculation Handbook". For ready reference, the formulas for calculating the forces developed by this contraction/expansion are given below:

F_1 (piston effect) = $(A_p - A_i)\,\Delta P_i - (A_p - A_o)\,\Delta P_o$
F_2 (buckling effect) = usually negligible
F_3 (ballooning effect) = $.6\,(\Delta P_{ia} A_i - \Delta P_{oa} A_o)$
F_4 (temperature effect) = $207\, A_s\, \Delta t$

The above forces are in pounds and the equivalent tubing movement can be obtained from the stretch charts in another section of this handbook or can be calculated using the formula:

$$\Delta L \text{ (stretch or contraction in feet)} = \frac{F \times L}{E \times A_s}$$

Where: F = force in pounds
L = tubing length in feet
E = elasticity factor of steel = 30,000,000
A_s = cross section area of tubing in square inches

Terms used in the force formulas are defined below:

A_s = cross section area of tubing in square inches = $A_o - A_i$
A_p = area of packer bore in square inches
A_o = area of tubing OD in square inches
A_i = area of tubing ID in square inches
ΔP_i = change in tubing pressure at packer in pounds per square inch
ΔP_o = change in annulus pressure at packer in pounds per square inch
ΔP_{ia} = change in average tubing pressure in pounds per square inch
ΔP_{oa} = change in average annulus pressure in pounds per square inch
Δt = change in average tubing temperature in degrees Fahrenheit

For more detailed information regarding tubing movement refer to the Baker "Packer Calculation Handbook."

Gas Flow Through Choke

A calculation of the volume of gas flowing through a choke may be made using the formula:

$$Q = \frac{C\,P}{\sqrt{GT}}$$

Where: Q = gas flow rate in MCF per day at 60°F and atmospheric pressure
C = choke coefficient, listed in table below for various size chokes
P = absolute flowline pressure upstream of choke, gage reading plus 15 psi
G = gas specific gravity
T = absolute gas temperature upstream of choke, °F plus 460

If neither temperature nor specific gravity are known, an approximation can be made by assuming a temperature of 80°F (540°F absolute) and a specific gravity of 0.6 for the gas. In this case the formula will be:

$$Q = \frac{C\,P}{\sqrt{540 \times 0.6}} = \frac{C\,P}{18} = .0555\,CP$$

Coefficient Table

Formulas for Capacity of Vertical Cylindrical Tanks with Flat Ends

Bbl per ft of depth of fluid = $.1400 \times D^2$ (ft)

Bbl per in. of depth of fluid = $.01165 \times D^2$ (ft)

Formulas for Capacity of Vertical Cylindrical Tanks with Flat Ends

Gal per ft of depth of fluid	=	$5.8752 \times D^2$ (ft)
Gal per in. of depth of fluid	=	$.4896 \times D^2$ (ft)
Cu ft per ft of depth of fluid	=	$.7854 \times D^2$ (ft)
Cu ft per in. of depth of fluid	=	$.06545 \times D^2$ (ft)
D	=	Diameter in feet

Formulas for Capacity of Rectangular Tanks with Flat Ends

For small or medium size rectangular tanks or pits measure the length and width in inches.

Bbl per in. of depth of fluid	=	.0001031 x L (in.) x W (in.)
Gal per in. of depth of fluid	=	.004329 x L (in.) x W (in.)
Cu ft per in. of depth of fluid	=	.005787 x L (in.) x W (in.)

L = Length in inches W = Width in inches

For large tanks or pits measure length and width in feet.

Bbl per in. of depth of fluid	=	.01484 x L (ft) x W (ft)
Gal per in. of depth of fluid	=	.6234 x L (ft) x W (ft)
Cu ft per in. of depth of fluid	=	.08333 x L (ft) x W (ft)

Formulas for Contents of Pipe Lines

Barrels per lin ft	=	$.0009714 \times D^2$
Lin ft per barrel	=	$\frac{1029.4}{D^2}$
Gallons per lineal ft	=	$.0408 \times D^2$
Lineal ft per gallon	=	$\frac{24.51}{D^2}$
Cu ft per lineal ft	=	$.005454 \times D^2$
Lineal ft per cu ft	=	$\frac{183.35}{D^2}$
D	=	Diameter in inches

Formulas for Velocity and Horsepower

Feet per second	=	$\frac{\text{BPH} \times .2859}{(\text{Diameter in inches})^2}$
Feet per second	=	$\frac{\text{BPD} \times .0119}{(\text{Diameter in inches})^2}$
Feet per min	=	$\frac{\text{GPM} \times .24.513}{D_1^2 - D_2^2}$

(D_1 = ID of outer string. D_2 = OD of pipe)

Hydraulic Horsepower	=	$\frac{\text{BPH} \times \text{Pressure (psi)}}{2447}$
Hydraulic Horsepower	=	BPH x Pressure (psi) x .000409
Hydraulic Horsepower	=	BPD x Pressure (psi) x .000017
Hydraulic Horsepower	=	BPM x Pressure (psi) x .0245
Hydraulic Horsepower	=	GPM x Pressure (psi) x .000584
Brake Horsepower	=	$\frac{\text{BPH} \times \text{Pressure (psi)} \times .000409}{\text{Efficiency}}$
Brake Horsepower	=	$\frac{\text{BPD} \times \text{Pressure (psi)} \times .000017}{\text{Efficiency}}$
Brake Horsepower	=	$\frac{\text{GPM} \times \text{Pressure (psi)} \times .000584}{\text{Efficiency}}$

Note: BPM = Barrels per minute BPD = Barrels per day
BPH = Barrels per hour psi = Pounds per square inch

Formulas for Jet Velocity

$$V\eta = \frac{0.32086\ Q}{A\eta}$$

Where: $V\eta$ = Jet velocity (ft/sec)
Q = Circulation rate (gpm)
$A\eta$ = Area of nozzle ($in.^2$)

Formulas for Jet Impact Force

$$I_f = 0.000518\ W\ Q\ V\eta$$

Where: I_f = Jet impact force (lb_f)
W = Mud weight (lb/gal)
Q = Circulations rate (gpm)
$V\eta$ = Jet velocity (ft/sec)

Formulas for Annular Velocity

$$V_a = \frac{24.51\ Q}{D_h^2 - D_p^2}$$

Where: V_a = Annular velocity (ft/min)
Q = Flow rate (gpm)
D_h = Hole diameter (in.)
D_p = Drillstring outside diameter (in.)

Formulas for Mechanical Horsepower

$$H_m = \frac{T\ S}{5252}$$

Where: H_m = Mechanical horsepower (hp)
T = Torque (ft-lb)
S = Speed (rpm)

Formulas for Hydrostatic Pressure

$P_s = 0.052 \times (TVD) \times Mw$
Where: P_s = Static pressure (psi)
TVD = True Vertical Depth (ft)
Mw = Mud weight (lb/gal)

$P_s = 0.0098 \times (TVD) \times Mw$
Where: P_s = Static pressure (kPa)
TVD = True Vertical Depth (M)
Mw = Mud weight (kg/m^3)

Formulas for Volume and Height Between Multiple Tubing Strings and Hole (or Casing)

Cu ft per lin ft	=	$(D^2 - d^2)\ 0.005454$
Lin ft per cu ft	=	$\frac{183.35}{D^2 - d^2}$
Gallons per lin ft	=	$(D^2 - d^2)\ 0.0408$
Lin ft per gallon	=	$\frac{24.51}{D^2 - d^2}$
Barrels per lin ft	=	$(D^2 - d^2)\ 0.0009714$
Lin ft per barrel	=	$\frac{1029.4}{D^2 - d^2}$

Formulas for Volume and Height Between Multiple Tubing Strings and Hole (or Casing)

Where: For Volume and Height between Tubing and Hole
D = Diameter of hole, inches
d = Outside diameter of tubing, inches
For Volume and Height between Casing and Hole
D = Diameter of hole, inches
d = Outside diameter of casing, inches
For Volume and Height between Tubing and Casing
D = Inside diameter of casing, inches
d = Outside diameter of tubing, inches
For Volume and Height between Casings
D = Inside diameter of outer casing, inches
d = Outside diameter of inner casing, inches

Maximum Recommended Rotary Speed for Milling Casing

Cu ft per lin ft	=	$(D^2 - d^2)\ 0.005454$
Lin ft per cu ft	=	$\frac{183.35}{D^2 - d^2}$
Gallons per lin ft	=	$(D^2 - d^2)\ 0.0408$
Lin ft per gallon	=	$\frac{24.51}{D^2 - d^2}$
Barrels per lin ft	=	$(D^2 - d^2)\ 0.0009714$
Lin ft per barrel	=	$\frac{1029.4}{D^2 - d^2}$

Where: D = Diameter of hole, inches (or ID of casing)
d = Outside diameter of tubing, inches

Formulas for Manual Tong
(Torque in Foot Pounds)

Line Pull (ft) x Tong Length (lb) = Torque in (ft-lb)
Example: Using 42 in. Tongs and applying 4,000 lb Line Pull will give 14,000 ft-lb of Torque

Decimal Equivalents of Fractions of an Inch in Inches and Millimeters

Fraction	Dec Equiv	*Millimeters*	Fraction	Dec Equiv	*Millimeters*

Formula used: $P = \frac{G^2 D}{12{,}031\ A^2\ C^2}$

Where formula applies:

IP = Pressure drop (psi) across rock bit nozzle
G = Flow rate of circulated fluid (gpm)
D = Fluid density (pounds per gallon)
A = Nozzle area in square inches
C = The coefficient of the orifice

Pressure Drop Across a Single Nozzle (Orifice)

Formula used: $P = \frac{G^2 D}{12{,}031\ A^2\ C^2}$

Where formula applies:

P = Pressure drop (psi) across rock bit nozzle A = Nozzle area in square inches

G = Flow rate of circulated fluid (gpm) C = The coefficient of the orifice

D = Fluid density (pounds per gallon)

Pressure Drop Across A Single Nozzle (Orifice)

Notes: 1. Volumes shown are for one complete cycle or revolution.
2.To get output in volume/minute, multiply output/cycle by pump RPM.
3. For triplex double acting pump, multiply output by 1.5.

Weight (lb/1,000 ft) (in air)	188	247	322	341	392	392	418	405	455

Data provided by Baker Atlas, a division of Baker Hughes, Inc., and is based upon published manufacturers' data; October, 2005

Notes:

Yield Strength is the point at which irreversible mechanical and electrical damage to the wireline occurs. The wireline cannot be used and must be replaced if the yield strength is exceeded.

Data provided is for new wirelines. Age and/or wellbore conditions may significantly degrade wirelines.

Wirelines are available from various manufacturers and may be constructed using a variety of alloys. Values quoted are for the lowest rated general service alloy ("improved plow steel") wireline of each size. Special purpose wirelines (such as H_2S service alloys) may have considerably different ratings; consult manufacturer's data sheets for ratings of specialty wirelines.

The strengths shown are theoretical calculations based on yield strength of the material used in each case. The strengths shown are therefore accurate, plus or minus 20 percent of the figures shown only. These figures do not constitute a guarantee, actual or implied; they are meant to serve as a guide only, and appropriate allowance must be made in use, as a safety factor.

■ Loads shown are maximum recommended pull loads. Pulling above the value shown can damage the tools.

All jarring and pulling loads shown assume that the force is acting alone and is essentially along with major axis of the tool. if torque and tension or bending and tension are used together, the resulting combined stresses may lead to failure at substantially less than rated loads. rotation and bending together can lead to fatigue.

Field Load: Max Pull Load (During Pull Stroke) (See Notes 2, 3 and 4)	(lb)	59,000	100,000	200,000	265,000
Lift Load: Tensile At Yield (Jar Fully Extended) (See Notes 2 and 4)	(lb)	257,000	484,000	900,000	1.58 million
Torque at Yield (See Notes 2, 4 and 5)	(ft-lb)	5,630	16,700	36,300	76,000

NOTES:

1) If jar does not test at Low and Standard Pull Loads shown, disassemble, inspect and repair tool.
2) All strengths listed are calculated theoretical yield points and are accurate within 20%. The strength values shown are based on only one (1) load type being applied at a time; this is consistent with API methods for their published strength values for drill string components. When two (2) or more load types (pull, lift, torque, rotation and/or bending) are applied at the same time, the stresses on the tool are increased and the listed load ratings are reduced substantially. This is particularly true in milling, washover or drilling operations; in deviated or directional holes; and in the neutral zone, where combining loads (stress) can also lead to fatigue failure. The need for operating under such conditions is acknowledged. This is not intended to advise against such operations, but merely to caution the operator of possible risks when operating in these conditions. Rotation and bending together can lead to fatigue failure. As with all oil field equipment, a safety factor should be applied with running the tools to avoid damage.
3) Loads indicated are Maximum Recommended Pull Loads during the pull stroke of the jars. Pulling above the value show can damage the jar. The Bowen Jar Placement Program should also be run to avoid excessively high impact loads.
4) The values shown do not cover API tool joints or other downhole connection strengths since various connections may be used on either end of the tools. Users should be guided by AP or other published specifications covering downhole connections for the connection strengths.
5) Torque at Yield is the value that will cause yield of the material in one (1) or more parts of a tool. It may or may not refer to yielding of a threaded connection within the tool, but will always refer to the weakest torsional components with the tool.
6) The make up torques are in maximum recommended make up torques for each connection. They are set at 50% of the calculated theoretical yield toque. Tightening torque values were calculated assuming Itcolube or similar anti-galling grease with low coefficient of friction being applied to all threads and butting shoulders of the connections. Tightening Torque values are in ft-lb. Multiply chart value by 0.1382 to obtain kg-m.
7) These weight values are provided as a guideline to the weight of drill collars to be used, and do not necessarily constitute the optimum weight for each hole condition which may be encountered. It is recommended that the Bowen Fishing Jar Placement Program be used.

All strengths maximum value-apply safety factor of 2 to the joint tensile yield strength

Δ Recommended make-up torque = 25 percent of maximum make-up torque-does not apply to X-line connections

■ Ratio of the joint tensile yield strength to the pipe tensile yield strength

● N-80 pipe

◆ The internal upset has been reduced

❒ J-55 material

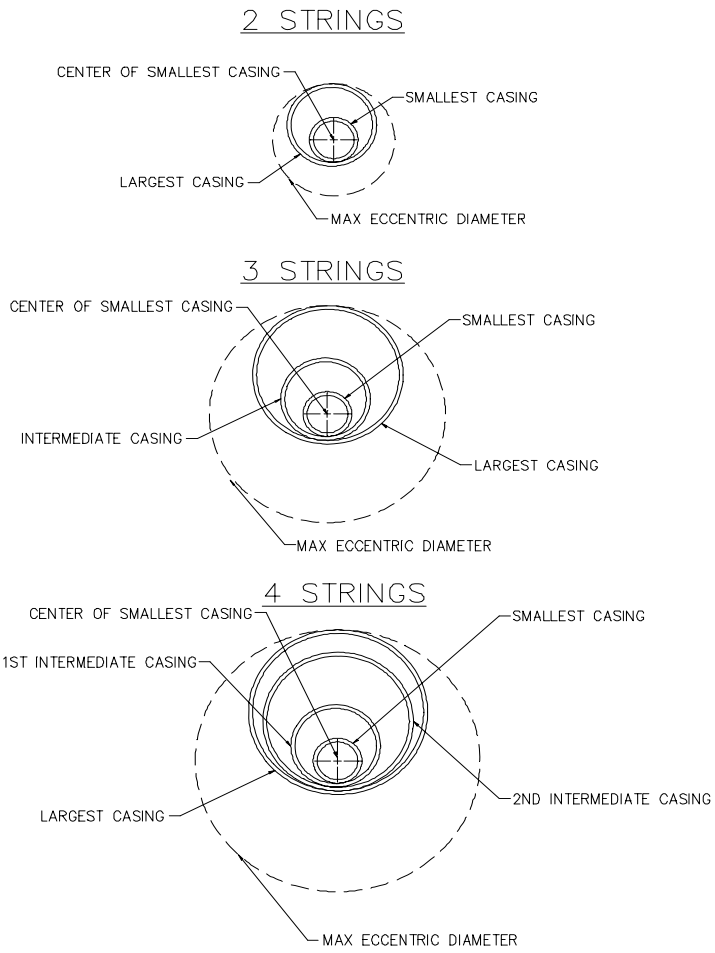
Determining the Eccentric OD for a Multiple Casing String Cut

The maximum eccentric OD must be considered when attempting to make a cut on multiple casing strings cemented into one another. Unless the casing is stabilized, the different size strings will lay to one side. In order to make a cut, the knives will have to swing out well beyond the OD of the largest size casing. See drawing below.



Max Eccentric OD=2*[OD $_{largest}$ -(t $_{smallest}$+t $_{1st\ intermediate}$ + t $_{2nd\ intermediate}$ + t $_{largest}$ + (ID $_{smallest}$/2))]

Definition Of Variables

Max Eccentric OD - has to be less than the max knife swing in order to perform a successful cut

OD $_{largest}$ - OD of the largest string of casing to be cut

t $_{smallest}$ - the casing wall thickness of the smallest diameter casing

t $_{1st\ intermediate}$ - the casing wall thickness of the 1st intermediate casing (used with 3 and 4 strings)

t $_{2nd\ intermediate}$ - the casing wall thickness of the 2nd intermediate casing (used with 4 strings only)

t $_{largest}$ - the casing wall thickness of the largest diameter casing

ID $_{smallest}$ - ID of the smallest string of casing to be cut

Example: What is the maximum knife swing necessary to cut 9-5/8" 47.0 # casing that is cemented in 13-3/8" 61.0 # and 24" casing with 1" wall.

First, the variables need to be defined:

Max Eccentric OD - this is what we are looking for OD $_{largest}$ - **24"**

t $_{smallest}$ - 9-5/8" 47.0# has a wall thickness of **.472"**

t $_{1st\ intermediate}$ - 13-3/8" 61.0# has a wall thickness of **.430"**

t $_{2nd\ intermediate}$ - **not needed**

t $_{largest}$ - 24" has a wall thickness of **1"**

ID $_{smallest}$ - 9-5/8" 47.0# has an ID of **8.681"**

Therefore:

Max Eccentric OD=2*[OD $_{largest}$- (t $_{smallest}$ + t $_{1st\ intermediate}$ + t $_{2nd\ intermediate}$ + t $_{largest}$ + (ID $_{smallest}$/2))]

Max Eccentric OD=2*[24"- (.472" + .430" + 1" + (8.681"/2))]

Max Eccentric OD=2*[24"- (.472" + .430" + 1" + (4.3405"))]

Max Eccentric OD=2*[24"- (1.902" + 4.3405")]

Max Eccentric OD=2*[24"- 6.2425"]

Max Eccentric OD=2*[17.7575"]

Max Eccentric OD = 35.515"

So the maximum knife swing must exceed 35.515"

EXPLANATION OF REED BIT TYPE DESIGNATIONS:
PREFIX:
EHP - Enhanced Performance bit with Threaded Ring* journal bearing and Mudpick* II hydraulics
EHT - Enhanced Hardmetal Tooth bit
EMS - Enhanced Motor Series bit with sealed roller bearing
ETS - Enhanced Turbine Series
HP - Premium journal bearing bit
MHP - Motor bit with journal bearing
MHT - Motor tooth bit with journal bearing and AmorClad* hardmetal
MS - Motor bit with sealed roller bearing
SL - Premium small diameter bits
Y - Non-sealed roller bearing bit

SUFFIXES ATTACHED AS PART OF REED NAME:
C - Center Jet
F - High velocity flame-blasted coating
G - Tungsten carbide heel pacs on steel tooth bits
JA - Bits for air applications
K - Shirttail protection
KPR - Premium shirttail protection - raised
L - Steel pads with tungsten carbide inserts
M - Mudpick II hydraulics
T - Gage Guard*

CUTTING STRUCTURE VARIANTS
A - Chisel-shaped inserts
H - Chisel-shaped inserts in 417-517 designs with 3-degree skew
X - Special cutting structure variations that may differ by bit type

DIAMOND ENHANCED SUFFIXES:
DA - Diamond Inner, Gauge & Heel Row Inserts
DG - Diamond Gauge Row Inserts
DGH - Diamond Gauge and Heel Row Inserts
DH - Diamond Heel Row Inserts
DI - Diamond Inner Row Inserts
DIH - Diamond Inner & Heel Row Inserts
DKP - Diamond Premium Shirttail Protection
DKPR - Diamond KPR
DL - Diamond Lug Pads
DN - Diamond Nose
DT - Diamond Gage Guard

NOTE: Bits shown are based on individual manufacturer's published availability data. Comparisons may differ in particular drilling areas. Your Reed-Hycalog representative can provide specific data for your needs.

EXPLANATION OF REED BIT TYPE DESIGNATIONS:
PREFIX:
EHP - Enhanced Performance bit with Threaded Ring* journal bearing and Mudpick* II hydraulics
EHT - Enhanced Hardmetal Tooth bit
EMS - Enhanced Motor Series bit with sealed roller bearing
ETS - Enhanced Turbine Series
HP - Premium journal bearing bit
MHP - Motor bit with journal bearing
MHT - Motor tooth bit with journal bearing and AmorClad* hardmetal
MS - Motor bit with sealed roller bearing
SL - Premium small diameter bits
Y - Non-sealed roller bearing bit

SUFFIXES ATTACHED AS PART OF REED NAME:
C - Center Jet
F - High velocity flame-blasted coating
G - Tungsten carbide heel pacs on steel tooth bits
JA - Bits for air applications
K - Shirttail protection
KPR - Premium shirttail protection - raised
L - Steel pads with tungsten carbide inserts
M - Mudpick II hydraulics
T - Gage Guard*

CUTTING STRUCTURE VARIANTS
A - Chisel-shaped inserts
H - Chisel-shaped inserts in 417-517 designs with 3-degree skew
X - Special cutting structure variations that may differ by bit type

DIAMOND ENHANCED SUFFIXES:
DA - Diamond Inner, Gauge & Heel Row Inserts
DG - Diamond Gauge Row Inserts
DGH - Diamond Gauge and Heel Row Inserts
DH - Diamond Heel Row Inserts
DI - Diamond Inner Row Inserts
DIH - Diamond Inner & Heel Row Inserts
DKP - Diamond Premium Shirttail Protection
DKPR - Diamond KPR
DL - Diamond Lug Pads
DN - Diamond Nose
DT - Diamond Gage Guard

NOTE: Bits shown are based on individual manufacturer's published availability data. Comparisons may differ in particular drilling areas. Your Reed-Hycalog representative can provide specific data for your needs.

IADC Dull Bit Grading

Cutting Structure				Bearings/Seals (5)	Gauge (6)	Other Dull Characteris-tics (7)	Reason Pulled (8)
Inner (1)	Outer (2)	Dull Char. (3)	Location (4)				
1 Inner Cutting Structure (All inner rows.) **2 Outer Cutting Structure** (Gauge row only.) In columns 1 and 2 a linear scale from 0 to 8 is used to describe the condition of the cutting structure according to the following: **Steel Tooth Bits** A measure of lost tool height due to abrasion and/or damage. **0- No Loss of Tooth Height.** **8- Total Loss of Tooth Height.** **Insert Bits** A measure of total cutting structure reduction due to lost, worn and/or broken inserts. **0- No Lost, Worn and/or Broken Inserts.** **8- All Inserts Lost, Worn and/or Broken.**		**Fixed Cutter Bits** A measure of lost, worn and/or broken cutting structure. **0- No Lost, Worn and/or Cutting Structure.** **8- All of Cutting Structure Lost, Worn and/or Broken** **3** Dull Characteristics (Use only cutting structure related codes.) *BC - Broken Cone BF - Bond Failure BT - Broken Teeth/Cutters BU - Balled Up Bit *CC - Cracked Cone *CD - Cone Dragged CI - Cone Interference CR - Cored CT - Chipped Teeth/Cutters ER - Erosion FC - Flat Crested Wear HC - Heat Checking JD - Junk Damage *LC - Lost Cone LN - Lost Nozzle LT - Lost Teeth/Cutters OC - Off-Center Wear PB - Pinched Bit PN - Plugged Nozzle/Flow Passage RG - Rounded Gauge RO - Ring Out SD - Shirttail Damage SS - Self Sharpening Wear TR - Tracking WO - Washed Out Bit WT - Worn Teeth/Cutters NO - No Dull Characteristics * Show Cone # or #'s under location **4**				**7** OTHER DULL CHARACTERISTIC Refer to column 3 codes. **8** Reason Pulled or Run Terminated BHA - Change Bottom Hole Assembly DMF - Downhole Motor Failure DTF - Downhole Tool Failure DSF - Downhole String Failure DST - Drill Stem Test LOG - Run Logs LIH - Left in Hole RIG - Rig Repair CM - Condition Mud CP - Core Point DP - Drill Plug FM - Formation Change HP - Hole Problems HR - Hours on Bit PP - Pump Pressure PR - Penetration Rate TD - Total Depth/Casing Depth TQ - Torque TW - Twist Off WC - Weather Conditions	

4 Location -
Roller Cone - Cone #
N - Nose Row- 1
M - Middle Row- 2
G - Gauge Row- 3
A - All Rows

Fixed Cutter
C - Cone S - Shoulder
N - Nose G - Gauge
T - Taper A - All Areas

5 Bearings / Seals
Non-Sealed Bearings
A linear scale estimating bearing life used.
(0 - No life used, 8 - All life used, i.e. no bearing life remaining.)

Sealed Bearings
E - Seals Effective
F - Seals Failed
N - Not Able to Grade
X - Fixed Cutter Bit (Bearingless)

6 Gauge Measure in 1/16 of an inch.
I - In Gauge
1/16 - 1/16" Out of Gauge
2/16 - 1/8" Out of Gauge
4/16 - 1/4" Out of Gauge

Recommended Roller Cone Make-up Torque

Bit Size		API Pin Size		Recommended Torque	
in.	*mm*	in.	*mm*	ft-lb	*Nm*
3-3/4 - 4-1/2	*95.2 - 114.3*	2-3/8	*60.3*	3,000 - 3,500	*4,000 - 4,800*
4-5/8 - 5	*117.5 - 127.0*	2-7/8	*73.0*	6,000 - 7,000	*8,000 - 9,500*
5-1/8 - 7-3/8	*136.5 - 187.3*	3-1/2	*88.9*	7,000 - 9,000	*9,500 - 12,000*
7-5/8 - 9	*193.7 - 228.6*	4-1/2	*114.3*	12,000 - 16,000	*16,000 - 22,000*
